1.3 Description of the Equipment under test (EUT)

1.3.1 EUT: Type, S/N etc.

Type of equipment : Link device to hearing aids

Model name Streamer Manufacturer Oticon A/S Address Kongebakken 9 2765 Smørum City Country Denmark Tested to Radio Standards Specification(RSS) No. : 210 Issue 6 Open Area Test Site Industry Canada Number IC 3463A-1 Frequency Range (or fixed frequency) 3.84 MHz

R F: Power in Watts : -/-

Field Strength (at what distance) : $0.06 \text{ mV/m} (35 \text{ dB}\mu\text{V/m}) \text{ in } 10 \text{m}$

Occupied Bandwidth (99% BW) : 387.5 kHz

Type of Modulation : A1D (inductive loop)

Antenna Information : Integrated Coil antenna and optional neckstrap-antenna

Emission Designator : A1D

Transmitter Spurious (worst case) : 143 µV/m in 3m (noise floor)

IC no. : U28STREAM01 FCC ID : 1350B-STREAM01

ATTESTATION:

DECLARATION OF COMPLIANCE: I declare that the testing was performed or supervised by me; that the test measurements were made in accordance with the above-mentioned Industry Canada standard(s); and that the equipment identified in this application has been subjected to all the applicable test conditions specified in the Industry Canada standards and all of the requirements of the standard have been met.

Laboratory Manager:

3 Measurements and results

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 20 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber.

The receiving antennas are conform with specifications ANSI C63.2-1996 clause 15 and ANSI C63.4-2003 clause 4.1.5. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test set-ups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received.

The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.4-2003 clause 4.2.

Antennas are conform with ANSI C63.2-1996 item 15.

150 kHz - 30 MHz: Quasi Peak measurement, 9kHz Bandwidth, passive loop antenna.

30 MHz - 200 MHz: Quasi Peak measurement, 120KHz Bandwidth, biconical antenna 200MHz - 1GHz: Quasi Peak measurement, 120KHz Bandwidth, log periodic antenna

>1GHz: Average, RBW 1MHz, VBW 10 Hz, wave guide horn

All measurement settings are according to FCC 15.209 and 15.207

4 FCC Part 15 Subpart C

4.1 Timing of the transmitter

Not applicable

Reference

FCC: CFR Part SUBCLAUSE § 15.35 (c) IC:

Measurement not applicable, transmitter is continous modulated (N0N)

Limits: § 15.35 (c)

(c) Unless otherwise specified, e.g. Section 15.255(b), when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted with any application for certification or shall be retained in the measurement data file for equipment subject to notification or verification.

4.4 Plots of measurements

Plot 1: Valid for both types of antenna (worst case) *Part 15.209 Magnetics TX*

RBW/VBW: 200 Hz up to 150 kHz, 9 kHz up to 30 MHz

Performed in a fully anechoic chamber at 3m to get an overview about radiated emissions. This values may have some errors because of the small distance between measureing antenna and sample.

Therefore we remeasured all found peaks at 10m. (see page 10)

(to convert the measuring distance from 10m to 30m and 30 to 300m a correction factor from 40 dB/decade was used. Here we use 40 dB to recalculate from 3m to 30m)

Measurement distance 3 m

This measurement was done in 3 planes, the plot shows the worst case ase
